Responses

What did you like most about this session?

Responses

An important message from the speakers, was that learning analytics can be a valuable tool for filling the gap between all the countries involved in the LALA project

The presentation and content

- Attendants interacting with the Poll system. - Good slides - Good English - Both speakers participated - KU Leuven Univeristy information at the beginning.

Things to consider when design for dashboard

the presentation is very concrete and reinforce the idea of the importance of the context "one size fits all" does not work

The demo website and the possibility to think about how to adapt the dashboards there to my school/context.

The different dashboards presentation, and real case examples.

use of survey to activate the audience   dynamics

The opportunity to work in chatting groups.

You presented it very well and clear. The live examples are a big plus   this app

The demo. It gave us a clear hands on experience on how the dashboard works.

Which lesson-learnt do you take home?

Responses

very interesting in doing research on dashboards for learning

- Stela/Able Project.
- Evaluation of the system build was great
- Monitor the system as you did when you launch the project
============

use the available data

There are different kind of feedback which provide different approach to improve teaching and learning process.

Things that need to consider for dashboard development

Dashboards can have a positive impact on key aspects of students' performance (such as time management)

paid attention to the counseling process

We should use the LA tool available to create our own tools, not only reuse them.

use online poll system

It is possible to do it. All you need is of course access to the data. You also have to consider cultural/institutional context.

Belgiums don't care about football :-)

We can do this!
